PROBLEM SHEET 1

Alex Kavvos

1. Write down a derivation of the judgement

- 2. (i) Write down the rules that generate lists of natural numbers.
 - (ii) Write down the associated induction principle.
 - (iii) In your notation, write a derivation of the judgement that [0, 1] is a list.
- 3. Prove that the following rule is derivable.

$$\frac{n \text{ even}}{\operatorname{succ}(\operatorname{succ}(n)) \text{ even}}$$

4. Prove that the following rule is admissible.

$$\frac{n \text{ even}}{n \text{ nat}}$$

(You might need to strengthen this statement a bit.)

5. (*) All the judgements we have seen up to this point have been unary, in the sense that they referred to only one entity. For example, the judgement n nat only refers to the object n.

However, judgements can have arbitrary arity, and can thus define arbitrary relations between an arbitrary number of objects. For example, the following ternary judgment sum(a,b,c) defines a relation between three objects: a,b and c.

$$\frac{b \text{ nat}}{\text{sum}(\text{zero}, b, b)} \\ \frac{b \text{ nat}}{\text{sum}(\text{succ}(a), b, \text{succ}(c))}$$

The judgement sum(a, b, c) can be written in more familiar notation as a + b = c.

Such judgements can be used—amongst countless other things—to define functions. This exercise is about showing that the above rules define the addition function.

- (i) Write down a derivation of sum(succ(zero), succ(zero), succ(succ(zero))).
- (ii) Restate the above rules as a Haskell function on the data type

Does your code use pattern matching? Discuss its relation to the rules given above.

- (iii) Prove that if sum(a, b, c) then a nat, b nat, and c nat.
- (iv) (Existence) Prove that if a nat and b nat then there exists a c nat such that sum(a, b, c).
- (v) (Uniqueness) Prove that if sum(a, b, c) and sum(a, b, c') it must be that c = c'.
- (vi) Conclude that $\mathsf{sum}(a,b,c)$ indeed defines a function on natural numbers.
